This README describes citeref.sty

LICENSE: BSD (https://ctan.org/license/bsd4)

CREDITS
 Partially based on CITESIDX.STY by Frank Buchholz
 Contributions by Florian Werner Sauer

Main purpose:
        Add reference-page-list to bibliography-items.

Features:
        - This is done WITHOUT using the index-facility.
        - Full transparency - no special \cite-replacement
        - Works with or without BibTeX
        - No extra LaTeX runs needed, neither external programs
        - Customizeable look of the back-references

Caveats:
        - Does probably NOT work with other \cite-related style-options
          which redefine the (internal) \@citex macro
        - Citation tags may no longer contain a '=' char due to expansion
          issues.

Usage:
        \usepackage{citeref}
        No Options declared

        Change Style of printed page references by redefining the macro
        '\bibitempages#1'. The parameter is a comma-separated list of
        page references. The default macro puts it into brackets [...].

        Print comments in the bibliography: Use the macro
        \bibintro{Blah...} before \thebibliography

Revision History:
        1999-01-05      Initial release
        1999-27-05      Got sometimes wrong page numbers;
                        Removed \immediate from \write of \citepageref-Macro
                        in redefinition of \@citex to fix this
        2018-04-07      Added licensing information
```
